

10.9b | Focus Irregularities and How They Impact Daily Life

Not a reader? Listen to the “Deep Dive” by NoteBookLM

Focus isn't a switch. It's a fluctuating tide, especially for neurodivergent people who struggle with regulating attention.

Hyperfocus

When interest and novelty collide, hyperfocus can kick in. Hours may pass while immersed in a single task. It's productive, but risky: meals, messages, or rest can vanish from awareness entirely.

Difficulty Maintaining Attention

Less-stimulating tasks create an internal friction. No matter how important the task is, the brain resists engagement. Reading the same line over and over? Zoning out mid-conversation? That's the attention system short-circuiting.

Easily Distracted

External inputs (noises, visuals) and internal ones (thoughts, emotions) compete constantly. It isn't a matter of willpower. The brain assigns equal priority to every input, making task completion exhausting.

Support Tips:

- Noise-canceling headphones
- Work sprints with short breaks
- Visual anchors and task prompts
