

10.9c | The Invisible Weight of Executive Function Challenges

Not a reader? Listen to the “Deep Dive” by NoteBookLM

Executive function is the brain’s control center—and when it falters, everyday tasks become overwhelming.

Task Initiation Difficulties

Getting started is often the hardest step. Even when the task is clear, crossing the mental threshold from "thinking" to "doing" feels impossible. This isn’t laziness. It’s neurological traffic.

Organization Struggles

Organizing tasks, spaces, or thoughts requires juggling multiple mental steps. For neurodivergent folks, this often leads to overwhelm or a unique, non-linear organizational system others might not understand.

Working Memory Issues

Working memory is short-term memory in action. When it’s limited, we forget mid-task instructions, lose our place in multi-step routines, or need constant reorientation.

Support Tips:

- Externalize tasks (lists, post-its, checkboxes)
- Use visual planning tools
- Break tasks into atomic steps
