- I'm most effective in async-first, visually structured environments.
- My strengths are systems thinking, automation, creative problem solving, and brand building.
- Please don't rush me — pressure makes my brain stall.
- Micromanagement kills my momentum. Trust and check-ins work better.

2.1 My Work Style

- I do best with visual dashboards, checklists, and flexibility.
- Verbal-only communication often slips through the cracks.
- I thrive when allowed to build and iterate — not follow exact formulas.

2.2 My Goals

- Build inclusive, scalable services
- Redefine productivity for neurodivergent minds
- Create tech that adapts to human energy, not the other way around

Based on the selected section, here's how Cody's work style and preferences reflect their intersecting identities:

Communication and Work Environment:

- Cody thrives in asynchronous, visually structured environments, which aligns with their neurodivergent needs by allowing them to process information at their own pace and reduce real-time communication pressure.

Working Style and Pace:

- They explicitly need freedom from rushing and pressure, as it can cause their "brain to stall", which is common for individuals with ADHD and PTSD when under stress.
- They prefer trust and periodic check-ins over micromanagement, reflecting the need for autonomy that many neurodivergent individuals require to work effectively.

Information Processing:

- Visual tools like dashboards and checklists are essential for their productivity, helping manage ADHD-related executive function challenges.
- Verbal-only communication is challenging for them, which is common for many neurodivergent individuals who process information better through visual means.

Professional Goals:

- Their goals reflect their lived experience and advocacy, focusing on building inclusive services and redefining productivity for neurodivergent minds.
- They aim to create technology that adapts to human energy levels, showing an understanding of diverse needs and experiences.
