- I’m obsessed with improvement but allergic to judgment.
- I learn through pattern recognition, visual mapping, and tactile practice.
- I’m constantly organizing my brain using tools like QuNote, mind maps, or journals.

Based on the selected section, here's how Cody's learning and creative style reflects their intersecting identities:

Growth Mindset with Self-Protection:

- While Cody has a strong drive for self-improvement, they're specifically "allergic to judgment", which likely stems from experiences as both a transgender person and someone with PTSD who needs to feel safe from criticism.

Neurodivergent Learning Style:

- Their learning approach through "pattern recognition, visual mapping, and tactile practice" aligns with common ADHD and neurodivergent learning preferences, where visual and hands-on methods often work better than traditional learning approaches.

Information Processing:

- The constant need to organize thoughts using "tools like QiNote, mind maps, or journals" reflects common ADHD coping strategies, helping to externalize thoughts and manage executive function challenges.

This combination of traits suggests someone who actively works to understand and accommodate their own needs while creating systems that support their unique way of processing information and engaging with the world.
